modified AGREE and using systematic reviews to supplement the evidence base when there is discordance among recommendations.

Background Evidence-based tools for symptom management were developed to assist healthcare providers in comprehensive assessment and appropriate management of symptoms. These evidence-based tools consist of comprehensive guides-to-practice, quick reference pocket guides, algorithms and smart phone apps.

Objectives The symptom management tools promote an interdisciplinary model of care that enables early identification and assessment of symptoms, appropriate documentation and communication regarding symptoms, optimal symptom management, and coordinated care throughout the illness trajectory. The tools are intended to be user-friendly, and are available in print, web and smart phone applications.

Methods The tools were developed by an interdisciplinary panel of healthcare providers using the ADAPTE guideline adaptation approach. This included a literature search for recent guidelines and systematic reviews, guideline appraisal using the AGREE tool and selection, and in some instances modification, of recommendations. Expert feedback was obtained and subsequently appropriate revisions were made.

Results The symptom management tools provide recommendations based on the best available evidence and expert consensus, for assessing, determining aetiology, diagnosing potential problems and for recommending non-pharmacological and pharmacological interventions.

Implications for Guideline Developers/Users The ADAPTE approach offers a comprehensive and rapid process of developing evidence-based tools for the cancer patient population. Following the global trend of creating user-friendly clinical guidance, the guides-to-practice, quick reference pocket guides, algorithms and smart phone apps are an innovative set of tools that are accessible to a diverse group of care providers, in a manner that would suit the individual’s clinical needs.

Methods This AHRQ funded work used a mixed-methods approach. We performed semi-structured telephone interviews and surveys to query developers about impressions of and intentions to implement the IOM standards in their CPGs. We also performed our own assessments of guidelines and compared them with developer self-ratings.

Results Of 14 developers, 43% utilised a systematic review to underpin their guidelines, and 57% felt they would in the future. Funding sources were not disclosed by 46% of the developers. While 80% utilised an evidence rating scheme, fewer rated the recommendations. Notable differences between developer self-ratings and researcher assessments of adherence occurred in several areas.

Discussion While some developers intend to improve processes to meet the Standards, others acknowledged they will not. Yet still others felt they already met the standards, but our assessment suggested a different estimation, revealing varying understanding among developers of the Standards.

Implications for Guideline Developers/Users The IOM standards will help identify rigorous and transparent evidence-based guidelines, but will pose implementation challenges. Education of developers on the Standards and expectations around them will be critical.
