Supplementary material 3. Vascular access device nomenclature

**Peripheral intravenous cannula (PIVC):** A catheter which terminates in the peripheral veins. PIVCs are often inserted in the veins of upper extremities (37) or alternative locations.

**Midline catheter (ML):** A catheter intended for short to intermediate term use, inserted into a peripheral vein in the upper arm via the basilic, cephalic, or brachial vein (38). The catheter tip terminates in a large peripheral vein distal to the axilla, outside the thoracic cavity (37).

**Peripherally inserted catheter (PICC):** A peripherally inserted central catheter is a device (central venous catheter) that is placed in the peripheral veins and whose tip terminates in the veins of the central circulation (e.g. cavoatrial junction).

**Non-tunneled Central Venous Catheter (nt-CVC):** A nt-CVC is a device (central venous catheter) that is directly inserted in the central veins whose tip terminates in the veins of the central circulation (e.g. cavoatrial junction).

**Tunneled Central Venous Catheter (t-CVC):** A t-CVC is a device (central venous catheter) that is placed such that the skin entry site and the vein entry site are separated by a subcutaneous space (e.g., tunnel). The tip of the catheter terminates in the central veins of the circulation (e.g. cavoatrial junction). The catheter may or may not have a tissue ingrowth cuff.

**Totally implanted venous access device:** A TIVAD (or Ti-CVC) is a device (central venous catheter) that has a septum/chamber/reservoir [that requires percutaneous/needle access] and is implanted in a subcutaneous tissue/pocket attached to a catheter whose tip terminates in the central veins of the circulation (e.g. cavoatrial junction), also referred to as a port, portacath or implanted port.

**Haemodialysis catheter (HDC):** A HDC is a device (central venous catheter) designed to allow high flow rates to permit hemodialysis or apheresis. The catheter tip may be staggered or have a splitter tip to prevent blood mixing at the inflow and outflow portions. The catheter may be non-tunneled or tunneled, with or without a tissue ingrowth cuff.
