though one of the authors, Adam Darkins, is surely fantasising that “five years from now we will all expect decision support when we look at treatment choices” – ten or fifteen years’ work, but a workshop mode of lay participation yielded some very germane points. And improving the communication that takes place through the media is certainly necessary; in May 1994 and the National Asthma Campaign has had to pick up the pieces of a huge “strokes scare” perpetrated by The People, and explain to caller after caller that “the asthma gene” has not in fact been found and the newspapers would have them believe.

But why does the report have to be so loaded with jargon? Do any of us actually like being called a “healthcare consumer” when we are ill? Why call the conference, “Involving Users of Health Services in Outcomes Research” instead of, “Asking Patients What They Want”? If those who commission and deliver care really want patients to help to make themselves better the first thing they need to do is to learn to speak in plain English.

National Asthma Campaign

But We are Different ... Quality for the Service Sector

It might seem impertinent to write a review and suggest that we write and talk less about quality in health care and more about the real nature of the health business so that we can understand more about what really needs to be done. I can disagree with nothing in this book; what concerns me is what it doesn’t deal with and its rather superficial and simplistic analysis of the issues. I doubt its influence on the quality in the service sector (sic).

For the try and explain why. John Macdonald is right when he questions the reluctance of the service sector to learn the lessons from the manufacturing sector. What is less clear is whether he also appreciates and values the distinctiveness of the service sector. It seems to me that by grouping financial services, the civil service, retail trade, local authorities, the transportation industry, the NHS, management consultants, education, and hotel and catering together in this apparently haphazard way he fails to demonstrate the essential nature of these various and quite different organisations that support them. This is not to say that each should learn from each other, just as each should learn from the manufacturing sector, but that simply transferring learning will work.”

Two obvious organisational issues differentiate public service industries – the health service, education, social services, and local government and property services: first there is a permanent dilemma in trying to meet the needs of the individual and the wider community simultaneously and second the service that is perceived and probably depends on the relationship between a professional – doctor, teacher, social worker, prison officer – and the individual user. These issues make the simple translation of methods that are effective in other sectors fail in these unique public service industries. A third issue, the prevalence of professionalisation, extends these characteristics of these public service industries, adds yet another dimension. Anyone who has worked in a hospital, a home for older people, a school, or a prison will be deeply aware of the problems of professionalisation on users and staff alike.

NHS readers of this book will be wary of the paucity of its analysis of the nature of health care and rightly sceptical of the chapter conclusions. Anybody who has read the Ritchie report into the treatment and care of Christopher Clunis will understand readily that while TCI (see below) will keep a lot of people engaged in time consuming activity it will hardly address the profound and endemic problems that pervade all the services that are designed to support, care for, and treat people with illness.

I just might be shroud-waving, claiming on behalf of these services, “But we are different ...” You might judge for yourselves, but the notion that health services are analogous, in managerial terms, to making “widgets” or even to Macdonald’s myth that has been around for over ten years and needs to be put to rest. QM and TCI (you will have read the book to know what it means) will not address the fundamental issues that an organisation like the NHS is facing; they could help, but not where the business happens. We need to get back to understanding the nature of the health business.

Quality Assurance in Nursing

Most contemporary nursing courses include instruction in the philosophy and methods of quality assurance. This text is aimed primarily at those nursing students undergoing Project 2000 diploma courses. It may also be used as an introductory text for qualified nurses who wish to develop an awareness of standard setting and audit. The core content of the book principally centres around the theory and application of the Dynamic Quality Improvement (DQI) system (formally DYSSSY) as formulated by Kitson and others. Students from other healthcare disciplines may find this book a useful introduction to the DQI system.

There are several other texts competing for this market niche. However, they invariably are broad in their description of the various quality assurance approaches available in nursing. In contrast, this book demonstrates the ”why and how to” of a well researched quality improvement approach in depth. It is also less intimidating. Its other merits include the simplicity of its description and the fact that all chapters contain explicit learning outcomes and study activities. Anybody who reads this book alone will make the patient uncomfortable, and will not prolong life.

Caring for the population of patients with AIDS presents unique problems, as

Palliative Care in Terminal Illness

Sitting down with this book, I recollected a consultation I witnessed as a medical student twenty years ago. A middle aged patient had come for the results of a bronchoscopy done six weeks previously. The physician said, “I’m sorry to tell you that you have incurable lung cancer and there is nothing anyone can do for you.” The patient gulped and left, and the consultant turned to me and said, “I always find it best to be frank in these cases.”

On the second page, I found a similar experience of bleak helplessness towards the hopeless case described by the authors, and from then on the book rang true. Although based on experience in the hospice setting, this overview of progress in palliative care over the past two decades is helpful and relevant to all those involved in care of the dying in hospital or the community.

Care with terminal incurable illness have various physical, social, spiritual, and practical problems, and the challenge is to relieve discomfort, enhance wellbeing, and foster realistic hope that good quality life may be enjoyed until the end. Carers do not need exceptional counselling or psychiatric skills, but rather sensitivity to the patients needs and wishes, sympathy and understanding.

Palliation is sometimes perceived wrongly, as placebo, but in fact many active measures are available to alleviate distressing symptoms. The management of dyspnoea, for example, includes practical advice – on sleeping upright; using a cool fan; taking drug treatments such as opiates, nebulised bupivacaine; and encouragement to try the unorthodox – diazepam. Common sense helps – cachexia is less of a problem if it is explained that force feeding and focusing attention on food will simply serve to make the patient uncomfortable, and will not prolong life.
