SUPPLEMENTAL MATERIAL 2. ADDITIONAL INFORMATION ON THE TEN INVESTIGATED PROCEDURES AS PROVIDED TO SURVEY RESPONDENTS

Procedure	Description
Induction of labour (IOL)	Induction means that the labour did not start by itself, and had to be
	started with an infusion, medication, a balloon or tablets.
External cardiotocography	CTG stands for 'cardiotocography', which is a method used to monitor
(CTG)	the baby's heart rate, and involves placing a belt around the abdomen of
	the mother.
Fetal scalp electrode placement	Fetal scalp electrode placement is a method used to monitor the baby's
	heart rate, and involves placing an electrode on the baby's head. This
	procedure is used during labour after the membranes have ruptured.
Artificial rupture of the	Artificial rupture of the membranes is when the care provider punctures
membranes (AROM)	the membranes during an vaginal examination. It's also known as
	breaking the waters. It may be done before labour (to induce labour) or
	during labour (accelerate labour).
Vaginal examination	During a vaginal examination the care provider inserts his or her fingers
	into your vagina, for example to see how labour is progressing.
Augmentation of labour	When labour starts spontaneously but does not progress, contractions can
	be stimulated by administering medication.
Episiotomy	An episiotomy is performed when the care provider makes a cut in the
	skin between the vagina and the anus with the aim to help the baby to be
	born faster in the second stage of labour.
Postpartum oxytocin	Oxytocin can be given after childbirth to make the uterus contract, with
administration	the aim to accelerate the birth of the placenta and prevent excessive
	bleeding.
Prelabour caesarean section	A caesarean section is the surgical delivery of a baby through the
(prelabour CS)	mother's abdomen, by making a cut (incision) in the abdomen and
	uterus. A Prelabour caesarean section is most often planned, and is
	performed when the labour has not started yet, for example when the
	baby is breech.
Caesarean section during labour	A caesarean section during labour is performed after the onset of labour.
(CS during labour)
